

Problem-Based Learning

General

Problem-based learning is a constructivist instructional strategy. One of the first and most commonly cited examples of problem-based learning was introduced in **1960s** medical education in Canada. It suggests learning will be more effective if **learners are faced with a real-life practical problem** they need to solve and

- *"empowers learners to conduct research, integrate theory and practice, and apply knowledge and skills to develop a viable solution to a defined problem."*¹⁾

What is problem-based learning?

In the 1960s at the McMaster University in Canada it was noted that medical education students were mostly bored during their classes, until they reached a stage where they were supposed to work with patients and try to help them solve their problems. It was then decided that biomedical problems, analyzed in small groups would be introduced into whole educational process, what remained a practice until today²⁾ and has also spread to other medical schools as well as other fields like nursing, law, engineering, management, business administration and other³⁾⁴⁾.

Although problem-based learning can be implemented on a variety of ways, its main **characteristics** are the following⁵⁾:

- Problem-based learning is a **learner-oriented approach**. *"Under the guidance of a tutor... the students must take **responsibility for their own learning**, identifying what they need to know to better understand and manage the problem on which they are working and determining where they will get that information..."*⁶⁾
- Learning occurs in **small groups** with usually 5-8 members and collaboration with other learners is necessary.
- Teacher has the role of a facilitator. Not by correcting students or providing them knowledge and guidance but by **asking questions** that the learners should be asking themselves in order to better understand the subject and by encouraging them to **apply their knowledge**.
- New (possibly interdisciplinary) information is acquired through **self-directed learning** and has to be applied on the problem.
- The **problem** learners are dealing with must be similar to **real-world** problems, **motivating** and **ill-defined** to enable multiple hypotheses to be constructed.

A possible **flow** of a problem-based learning course expects the following tasks from the students:

- be **presented with a problem** with characteristics described above,
- **discuss**, clarify the problem (activate prior knowledge⁷⁾) and develop a plan for further working on the problem,
- **work on the problem independently** and learn through self-discovery,
- **share and discuss** their individual approaches and work together,
- **present their solutions** to the problem, and
- **review** what they have learned.

Problem-based learning can be a helpful method in the educational process, but it can also be viewed as a **total education strategy**⁸⁾.

Different experimental results have been obtained using problem-based learning, but generally showing not much difference in declarative knowledge in students learning through problem-based design and those using classical teaching methods. Still, there is evidence that problem-based learning **supports development of reasoning skills, problem-solving skills and self-directed learning skills**⁹⁾.

What is the practical meaning problem-based learning?

Criticisms

Problem-based learning was addressed in [criticisms](#) of Kirschner et al.¹⁰⁾ These criticisms mostly refer to cognitive load imposed by **lack of guidance**, possible **frustration** caused by lack of knowing what is important, what should be learned and where these information can be obtained. It also ignores the proved positive effects of **worked examples**.

A reply to these criticisms was written by Schmidt et al.¹¹⁾ suggesting positive characteristics/improvements to problem-based learning and compatibility of it with the human cognitive structure like:

- activation of prior knowledge in the initial discussion of the group,
- training students in collaboration skills before a problem-based learning curriculum to decrease cognitive load,
- sequencing learning tasks simple to complex,
- recommending learning materials to students when they need help,
- guiding students when necessary to prevent them from losing too much time on irrelevant information.

Yet most of the proves for these thesis seem not convincing enough, the positive effect of worked examples is still ignored and even though some of the above statements could improve problem-based learning, they oppose the basic assumption that problem-based learning is self-directed¹²⁾¹³⁾.

Keywords and most important names

- **Problem-based learning, PBL, discovery-learning, self-discovery**
