Ontology

What is an ontology?

In philosophy,

• "ontology is the study of being or existence. It seeks to describe or posit the basic categories and relationships of being or existence to define entities and types of entities." 1

In modern computer science and information science basic definitions consider an ontology to be:

- "a data model that represents a set of concepts within a domain, and the relationships between those concepts"²⁾
- "an explicit specification of a conceptualization." 3)
- "an explicit formal specification of the terms in the domain and relations among them"

In more details, an ontology can be described as:

- a formal explicit description of *concepts* or *classes* in a domain of discourse, with
- properties of each concept describing various features and attributes of the concept (slots, roles or properties), and
- restrictions on concept slots (facets or role restrictions).

An ontology has the following properties:6)

- it is used to reason about the objects in a domain;
- specifies the classes of concepts and their relations at a higher level than relevant to the domain:
- captures the intrinsic conceptual structure of a domain;
- forms the hearth of the knowledge representation within a domain.

Why do we need an ontology?

An ontology can be used to:7)

- share common understanding of the structure of information among people or software agents
- enable reuse of domain knowledge
- make domain assumptions explicit
- separate domain knowledge from the operational knowledge
- analyze domain knowledge

So how do you create an ontology?

You can follow this brief guide.

Rana, Noman. Small Business - The Art of the Start. Self-Help Publishers, 2009.
