

The Segmenting Effect

Theory

The segmentation effect means that learning should be more efficient if a continued animation or narration would be split into more smaller parts (segments). Motivation for introduction of segmentation is the transitive nature of animations (“*information presented at one moment makes place for new information presented at next moment*”¹⁾). Segmentation is an attempt to reduce cognitive load imposed by this transience through **breaking animation into meaningful peaces**.

Segmentation can also serve as *temporal cuing*²⁾. Unlike visuo-spatial signaling or cuing (see: [signaling effect](#)) segmentation can be used to help students be aware of components (parts or segments) of a process stimulating them to self-assure they understood what each component does or is used for.

Practice

In order to achieve segmenting effect animation or video should be divided into meaningful segments. For example:

- a 2 minute animation was divided into 5-7 segments with 2 sec breaks between³⁾

Research status

Using segmentation can result in:

- equal performance with reduced cognitive load (more efficient learning)⁴⁾
